ABSTRACT

At present, a portable telephone which is capable of connection to Internet and sending and receiving electronic mails by use of a communication function has been developed, but for example, in a foldable portable telephone, in case of sending a mail, there is a necessity to take the trouble to open the portable telephone and to input characters by use of a main liquid crystal and an operation key which were formed on the front surface of the housing, and a study regarding usability has not been carried out sufficiently.

In order to solve the above-described problem, provided is a portable terminal in which a first and a second housings are foldable through a hinge part, and in a state that the first housing and the second housing have been folded, it is possible to shoot a motion picture or a still picture, and, in the state that the first housing and the second housing have been folded, by use of a screen display which does not have an input region of character information, the motion picture or the still picture which was shot is sent to a desired address.
